

Case Study

"Not all stains are created equal"

Type of Mark/ Stain?	Age of stain?	Material type?	Application details.	Conclusions.
Multiple	Unkown	Mixed Fibres	Development	New Process

Additional comments: MX14 is part of Aerospace Research and Development company and as such is constantly developing new processes for the cleaning and removal of stain and marks on passenger aircraft seating with the priority to find solutions in recovering items that were once considered scrap and thrown away. Our mission is to reduce waste, recover the recoverable and help all our customers to have a positive experience.

These seat "toppers" were destined for disposal. A waste of materials, resources and damaging to the environment, not to mention at \$2,000 each a huge waste of money. The purpose of this project was to identify the possibility of cleaning and recovering these items and to keeping within the required regulations. With a combination of the **MX14** solution and a new and innovative application system we have not only removed unknown aged stains but also comply with all the applicable laws and requirements. We don't just supply a cleaner, we also strive to develop new systems and solutions. If you don't see the results you want send us an email and see if you qualify for our free "send and return" service.
